## The use of probiotics and premixes as a solution for antibiotic free feeding in shrimp production in South East Asia

### Introduction

Recently, growing awareness from consumers and producers of aquaculture species has resulted in calls for responsible and sustainable aquaculture, also in the much debated shrimp production in South East Asia. Public opinion and regulation authorities in most export countries focus now on the misuse of antibiotics in aquaculture and public attention has shifted towards production methods.

Directly fed probiotics seem to be a promising sustainable additive to stimulate shrimp growth and secure a low disease response. In shrimp grow-out, Massam (2005) found directly fed probiotics an effective tool to boost survival, while Decamp *et al.* (2005) studied the effect of probiotics on one Asian shrimp hatchery. However large scale field data from hatcheries are still missing.

### Material and methods

During the year 2005 several trials were performed in South Vietnam in a wide range of hatcheries using a single-strain fermented probiotic feed additive, containing *Bacillus* sp., *Enterococcus* sp. and *Lactobacillus* sp., designed to improve bioavailability in shrimp larvae used from early Zoea to later Post Larvae stages. The trials were carried out in 56 hatcheries from Nauplii state until PL 12.

### Results and conclusions

Average results from all farms are shown below and based on triplicates in each farm.

Table 1: Survival in hatcheries using the probiotic blend (DynaGain®) until PL 12 in *Penaeus monodon*

Hatcheries	Control containing antibiotics	Probiotic blend*
15 hatcheries	50.0%	53.3%
12 hatcheries	45.0%	45.8%
9 hatcheries	55.0%	58.3%
20 hatcheries	50.0%	51.3%

\*DynaGain® is a trademark of Mangrove Coast Ltd., Vietnam

Based on these results it could be concluded that the chosen probiotic can be an alternative for an antibiotic-free hatchery operation under the circumstances in Vietnam.
